

INTRO/ABSTRACT

Analysis of Alternatives is a project about conducting research on workstation deployment software for GTRI. The first phase was to conduct research into different software and listing the pros and cons to each that we select while seeing if they meet the requirements given to us by the sponsor. Three software are chosen from the research phase based on requirements met and testing would be conducted with each software to see if the requirement was met. After all testing is completed, the team would choose our recommended software based on research and testing data to GTRI.

METHODS

The team had little knowledge of Deployment software, so our main source of research was from Google when seeing if the software met the requirement. The team has also used installation guides either on the software's website or on YouTube when testing.

RESULTS

Top 3 Software Chosen:

1. Endpoint Central
2. Ivanti
3. Clonezilla

Final recommendation:

Endpoint Central

Analysis of Alternatives OS Deployment Software Research and Recommendation
