ABSTRACT

Weak enrollment growth has been a concern for many Information Systems (IS) programs in recent years although the IT/IS job market remains strong. Stimulating undergraduate students’ interest to IS programs have been a challenge. In this paper, the researchers took a comprehensive approach to study how to effectively promote a Management Information Systems (MIS) program to undergraduate students at a medium-size public university in the southeastern US. Using a survey-based method, the researchers first investigated the factors that impact students’ selection of majors and identified students’ perceptions on an MIS program. In this paper, an MIS program promotion strategy was then developed and empirically validated. The research results showed that the promotion strategy can successfully stimulate participants’ positive perceptions on the MIS program. The approach presented in this study could serve as an exemplar to other IS programs or other major fields to tackle enrollment challenges.
